Description

This system allows the croupier to take cash for chips bought at the table easily and with absolute control over the gaming table. This speeds up the entire cash-taking process and provides greater security and control.

It detects the authenticity of bills instantly thanks to its approved ECB-certified bill checker. MoneyGuard EASYDROP: It fits completely flush into the gaming table with our patented vertical drop system.

The software allows you to have complete "on line" control over all the cash taken at all the tables in a CASINO. The tables can be monitored at all times, with alerts sent to a PDA/smartphone or other device, when the "STAKER" is reaching the established limit set based on capacity, making it easy to change the set-up without stopping the table.

Each Staker has a unique code controlled by "RFID", which allows for monitoring to the counting room. Even before opening, the Staker in the counting room knows the cash they will receive to balance the tables.

It has "seven programmable buttons", which can be assigned to players (position at the gaming table), calls to security, calls to the Bar, etc.

It is the only system on the market that accepts, pays, controls and cancels "TiToS" (optional, requires integration).
